

## WHAT'S NEW!

### BBC News "Fibres" 10 Downing Street

In a further effort to simplify facility access, BBC News has permanently installed fiber optics into 10 Downing Street, running from the street access closet to the White Room. The Telecast Tac-4 cable terminates at access panels with the Packard-Hughes 4-pin military hermaphroditic optical connector.

With this setup, one connection from the Viper to the panels at each end is sufficient to support three cameras with videos, audios, intercom, data and tally signals.

For the past 4 years the British Broadcasting Corporation has been a leader in the use of fiber optics for news and sports broadcast production. Today BBC News London Facilities employ Telecast Vipers on their news vehicles and fly-away units in order to get faster response and greater productivity.
